

Tutorial: How to Use the Hourly Weather Graph

The National Weather Service transitioned to digital forecasts in 2002, using a software package called the Interactive Forecast Preparedness System (IFPS). With this type of system, forecasters can manipulate grids of weather variables graphically, and then generate different formats of forecasts for thousands of points across the country in a matter of minutes.

One of these formats is called the Hourly Weather Graph, and it can be a valuable tool to evaluate the weather forecast for the upcoming week. In this document, we'll take you through a step-by-step process in order to understand how to use the Hourly Weather Graph.

Step One

Access the NWS Duluth home page – <http://www.weather.gov/duluth>

National Weather Service Weather Forecast Office
Duluth, MN

Frequently Used Products

Step Two

Choose a forecast location

You achieve this by either clicking at any point on the map on the home page, or by typing in a city and state, or zip code, in the white input box in the upper left hand corner of the web page. Let's assume for purposes of this tutorial that you typed "Hibbing, MN" into the box.

Step Three

Scroll down the forecast page

After you click the map or complete your search, the forecast page for the location you selected will come up. At the top, you will see the standard 7-day forecast. Scroll down the page.

This will bring up the Hourly Weather Graph Page. You'll also notice that right above that link box, there is an interactive Google map that you can use to fine-tune your location. Use the navigation tools to pan and/or zoom. You can even switch to a satellite view and find your building or house. If you find that your location is outside of the red box, you can click on the map, and it will change the forecast page to that location.

What the Hourly Weather Graph Looks Like

Above is a picture of what the Hourly Weather Graph page looks like. You can choose the weather elements that you'd like to view at the top, and change the 48-hour period that you'd like to view in the drop down menu. If you'd like to see the forecast at a specific time, simply mouse over the graph, and the text box at the bottom of the page will change as your mouse moves left or right on the graph. Thus, the Hourly Weather Graph allows you to view the forecast graphically, and get specific forecast information all on one web page.

Tutorial: How to Use the Activity Planner

Similar to the Hourly Weather Graph, the Activity Planner takes advantage of the Interactive Forecast Preparedness System (IFPS). It is simply another way of viewing the same digital forecast information.

Step One

Access the NWS Duluth home page – <http://www.weather.gov/duluth>
Click on the “Activity Planner” link on the left hand navigation menu.

The screenshot shows the National Weather Service website for Duluth, MN. The page is titled "National Weather Service Weather Forecast Office Duluth, MN". The navigation menu on the left includes links for "Local forecast by 'City, St' or Zip Code", "XML RSS Feeds", "Current Hazards", "Current Conditions", "Forecasts", "Hydrology", "Climate", and "Weather Safety". The "Activity Planner" link is highlighted with a red box and a red arrow pointing to it. The main content area features a "Top News of the Day" section with links to "La Nina Conditions In Pacific - What Does It Mean For Northland Winters?", "Get the Latest Beach Forecast, including Rip Current Outlook", "July 23rd Hailstone from Vivian, SD Recently Confirmed as US Record", and "Listen to the NOAA Weather Radio Online". Below the news is a "Watches & Warnings" section with a map of the Duluth area. The map shows various locations including International Falls, Bemidji, Hibbing, Duluth, Grand Marais, Brainerd, Hinckley, Hayward, Park Falls, and Ironwood. A red arrow points to the "Activity Planner" link in the navigation menu, with the text "Click link" next to it. The weather summary at the bottom shows "Latest Conditions in Duluth, MN" for "Aug 27" at "8:55 am" with a temperature of "63°F (17°C)" and "Clear" conditions. There is also a "Choose Your Front Page City" dropdown menu.

Step Two

Enter in your personalized forecast criteria in the “Element” white boxes. For instance, if you are fishing on a large inland lake, and you don’t want the wind speeds to be any higher than 30 mph, you would enter a “30” in the “Max” box next to “Surface Wind Speed (mph)”. Or, perhaps you are looking for days with low precipitation chances. For this example we will enter a 30 into the “Max” box next to Precipitation Potential to find the times over the next 7 days where the precipitation chances are less than 30%. Click on the map, or enter the latitude and longitude of a point, in order to get the forecast information for the site that you want. We will select Hibbing again.

Weather Activity Planner

Welcome to the **Weather Activity Planner**. Please enter the range of weather parameters required for your activity. Then, either click the approximate location on the map below, or enter the specific latitude and longitude and hit submit. This will query the forecast grids to find when your weather requirements will be met at the nearest grid point over the next 7 days. Public **comments and suggestions** are encouraged.

This application generates products from a digital forecast data base. It is intended to allow a user to define and produce a forecast for general planning purposes only. As any weather or hydrologic event evolves, updated forecasts and warnings are issued by the NWS. Customers are urged to obtain the latest official forecast information prior to engaging in any weather sensitive activity, and to monitor forecasts for updates during such activities.

The **Weather Activity Planner** is NOT meant to replace a spot forecast request. **Weather Activity Planner** surface winds are a gridded representation of projected, local surface winds at a 5km or 2.5km resolution. The surface winds returned do NOT account for fuel type, sheltering or slope aspect. Users can select either surface wind speeds or 20 foot winds (if the 20 foot wind grid is available). If precise wind forecasts are needed, please submit a spot forecast request to your servicing Weather Forecast Office.

Element	Min	Max	Element	Min	Max
Temperature (°F) <input type="text"/>	<input type="text"/>	to <input type="text"/>	Surface Wind Speed (mph) <input type="text"/>	<input type="text"/>	to <input type="text"/>
Relative Humidity <input type="text"/>	<input type="text"/>	to <input type="text"/>	Sky Cover <input type="text"/>	<input type="text"/>	to <input type="text"/>
Surface Wind Speed (mph) <input type="text"/>	<input type="text"/>	to <input type="text"/>	Precipitation Potential <input type="text"/>	0	to 30

Latitude/Longitude Entry
decimal degrees (i.e. 42.134) or deg min sec (i.e. 42 23 34)
Use "-" (negative sign) in longitude for locations in Western Hemisphere

Latitude: **Longitude:**

You can see that the Activity Planner produced a graph. The brown bar on the graph represents the times at which the precipitation probabilities are less than 30%. In this example, there is a long stretch of pretty dry weather from the current time through around 7pm on Monday.

If you want more specific information, you can mouse over the graph and it will provide the specific data point below the graph, as was the case in the Hourly Weather Graph. You can also click on the graphical output to get a tabular display of all the data at that particular point. Finally, you can always fine tune your criteria in the gray box closer to the bottom. **It is important to note that you can use more than one criterion at a time.**

Summary

Both of these options are ways for the user to interact with the digital forecast database in order to get the specific forecast information that they need. The Hourly Weather Graph provides a graphical display of forecast trends, and an easy way to view specific forecast information at a specific time in the future. The Activity Planner is potentially useful for anyone planning an outdoor event as it will isolate the times in the forecast where the weather forecast is ideal for the user.
