ICE IN THE OHIO RIVER AT CINCINNATI 1974 THROUGH 1988

Ice has appeared in the Ohio River at Cincinnati in 74 of the past 111 winters since 1874, 37 winters (33.0%) having been without ice, while the formation of ice is directly related to the temperature of the water which must be at or near freezing, the official minimum atmospheric temperatures at Cincinnati have averaged as follows: with the occurrence of light ice 13°, heavy ice 9°, frozen 3°.

Light floating ice has usually been followed in about one day by heavy floating ice; and the river has usually frozen over after about three days of heavy ice. Actually, however, considerable quantities of light ice have appeared 71 times and heavy ice followed it only 54 times; while heavy ice appeared 15 times without light ice preceding it. The river has frozen over in only 14 winters in the 111 years of record, always following heavy or gorged ice.

As the navigation dams increase in size, the deeper and larger pools retard somewhat the formation of ice in the river. Before the completion of Dam 37 at Fernbank, Ohio, the Cincinnati stages were frequently as low as five feet. After 1936 the stage at Cincinnati was rarely less than eleven feet; and, since January 1, 1963 Warsaw-Markland Dam has maintained a stage of more than 25 feet at the Cincinnati gage.

Character and dates of ice from 1874 through 1985 follow:
