(DC-Z001) DISTRICT OF COLUMBIA				
	05/18/11 07:18 EST		0	Coastal Flood
	05/18/11 08:12 EST		0	

A potent onshore existed between high pressure over New England and low pressure over the Midwest. The onshore flow caused tidal anomalies to increase over the Tidal Potomac River.

(DC-Z001) DISTRICT OF COLUMBIA				
	05/19/11 07:23 EST		0	Coastal Flood
	05/20/11 15:42 EST		0	

Heavy rainfall on May 17th and 18th caused elevated fresh water levels upstream along the Potomac River. A rush of freshwater from the Potomac River caused water levels to rise along the Tidal Potomac River near Washington DC on the 19th and 20th.

The elevated water levels caused moderate coastal flooding for areas near the Tidal Potomac River in Washington D.C.

<p>A southerly flow between upper-level low pressure over the Midwest and upper-level high pressure over the Atlantic Ocean produced a warm and moist airmass over the region. A surface trough also remained overhead during this time. The instability from the airmass along with the surface trough triggered showers and thunderstorms. High amounts of instability along with strong winds aloft caused thunderstorms to become severe with large hail being the primary threat.</p>

Quarter sized hail was estimated near Middleburg.

Low pressure both at the surface and aloft developed over the Mid-Atlantic during the 16th. A southeast flow around this system ushered in plenty of moisture off the Atlantic Ocean. The moisture caused moderate amounts of instability to develop. The combination of the instability and an upper-level disturbance in the southeast flow aloft caused showers and thunderstorms to develop. Some thunderstorms did become severe with damaging winds and large hail.

Valley View Drive was closed near Bristow Road due to flash flooding.

A nearly stationary area of low pressure over the Ohio Valley produced several days of intermittent showers and thunderstorms across the mid-Atlantic leading up to May 16th. On the afternoon and evening of May 16, training thunderstorms over saturated produced in excess of 2 inches of rain across portions of Prince William County and adjacent independent cities. This prompted flash flooding over the southwestern suburbs of the Washington metropolitan area.

Water of a depth of at least 6 inches was flowing across Featherbed Lane north of Route 29.

A nearly stationary area of upper level low pressure system over the Ohio Valley provided plenty of lift to combine with an usually strong and moist southeasterly low-level flow to produce bands of moderate to heavy showers across the mid-Atlantic. With saturated ground in place and the training nature of the widespread showers, flood and flash flooding was the result across portions of northern Virginia. Rainfall amounts of over 3 inches were common and included a measurement of 4.48 inches from Earlysville, VA.

The Buffalo Gap High School press box was damaged by thunderstorm winds.				
A southerly flow between upper-level low pressure over the Midwest and upper-level high pressure over the Atlantic Ocean produced a warm and moist airmass over the region. A surface trough also remained overhead during this time. The instability from the airmass along with the surface trough triggered showers and thunderstorms. High amounts of instability along with strong winds aloft caused some thunderstorms to become severe west of the Blue Ridge Mountains.

Flooding around Capon Bridge, WV forced closure of several roads, including Route 50, Cold Spring Road, and River Road. A nearby rain gage measured 1.95 inches.

A nearly stationary area of upper level low pressure system over the Ohio Valley provided plenty of lift to combine with an usually strong and moist southeasterly low-level flow to produce bands of moderate to heavy showers across the mid-Atlantic. With saturated ground in place and the training nature of the widespread showers, flood and flash flooding was the result across portions of eastern West Virginia. Rainfall amounts of over 3 inches were common and included a measurement of 3.80 inches from near Kline Gap, WV.

<p>A southerly flow between upper-level low pressure over the Midwest and upper-level high pressure over the Atlantic Ocean produced a warm and moist airmass over the region. A surface trough also remained overhead during this time. The instability from the airmass along with the surface trough triggered showers and thunderstorms.
