A low pressure system tracking from the Great Lakes into New England dragged a cold front through the Mid-Atlantic during the evening hours. Ahead of the front, with the region in the warm sector, the combination of moisture and warm air advection produced moderate levels of instability. This with deep layer shear of 25-35 knots was conducive for the development of thunderstorms.

<p>A low pressure system tracking from the Great Lakes into New England dragged a cold front through the Mid-Atlantic during the evening hours. Ahead of the front, with the region in the warm sector, the combination of moisture and warm air advection produced moderate levels of instability. This with deep layer shear of 25-35 knots was conducive for the development of thunderstorms.</p>

Storm Data and Unusual Weather Phenomena - June 2016

Location	Date/Time	Deaths & Injuries	Property & Crop Dmg	Event Type and Details
----------	-----------	-------------------	---------------------	------------------------

The National Weather Service, Baltimore-Washington DC Weather Forecast Office, conducted a survey of storm damage that occurred in western Howard County Maryland from severe storms that struck that county shortly after 1 pm EDT on Tuesday, June 21, 2016. Estimated maximum wind speed was 80 mph, making the tornado an EF-0.

Initial tornado touchdown was established near the intersection of Old Annapolis Road and St. Michaels Road just southwest of Lisbon at 129 PM EDT. Properties there sustained tree damage with multiple trees snapped, uprooted, and topped in multiple directions. A large garage had its doors bowed by the wind. Small objects were lofted.

The tornado continued towards the southeast, passing through the areas of Glenwood and Glenelg, before lifting just before Ellicott City in the vicinity of Manor Lane and Carroll Mill Road. Along its path, the tornado caused nearly continuous tree damage, with large trees and tree branches snapped, uprooted, and topped in multiple directions. The trees downed many power lines and blocked multiple roads. Some trees and large branches fell on homes and garages. There were a few instances of minor roofing damage from the wind, but largely home damage was limited to tree falls. Several small outbuildings were either damaged or destroyed.

Minor wind damage from strong thunderstorm winds continued southeast into Ellicott City, but no tornado damage was found. Tree damage from thunderstorm downburst (straight-line) winds was noted as far west as Schafferville Rd, between Long Corner Rd and Florence Road.

Multiple trees down across Caledon State Park.				
A low pressure system tracking from the Great Lakes into New England dragged a cold front through the Mid-Atlantic during the evening hours. Ahead of the front, with the region in the warm sector, the combination of moisture and warm air advection produced moderate levels of instability. This with deep layer shear of 25-35 knots was conducive for the development of thunderstorms.

Patterson Creek exceeded its flood stage between 6/2 2321 EST and 6/3 0030 EST. The gauge peaked at 9.05 feet at 6/3 00:00 EST. Agricultural and minor street flooding occur in the area when flood stage is exceeded.				

A cold front approached the region while Tropical Storm Bonnie was off the Outer Banks of North Carolina. Full sunshine and easterly flow across the area led to instability and showers and thunderstorms produced heavy rainfall that led to flooding across Central Virginia and the Potomac Highlands.

A low pressure system tracking from the Great Lakes into New England dragged a cold front through the Mid-Atlantic during the evening hours. Ahead of the front, with the region in the warm sector, the combination of moisture and warm air advection produced moderate levels of instability. This with deep layer shear of 25-35 knots was conducive for the development of thunderstorms.
