Flooding occurred around DC-295.				
A weak cold front slowly moved through the area later on the 8th into the 9th. A wave of low pressure tracked along the front, passing through the area during that time. Plenty of moisture ahead of the boundary along with moderate instability led to areas of heavy rainfall. The slower storm motion and training storms led to areas of flooding and flash flooding.

Several trees blew down northeast of the U.S. Capitol, including several onto vehicles on Morse Street Northeast.

An outbreak of significant severe weather occurred during the afternoon and evening hours of Tuesday, July 12th, 2022. An unseasonably strong cold front interacted with a high instability airmass to result in several bowing lines of thunderstorms, which maintained their organization and intensity due to strong atmospheric wind shear. Swaths of widespread damaging winds were observed, much of which was considerable. A couple of tornadoes were also confirmed, along with some significant hail. A wind gust of over 100 MPH was measured in one of the most powerful storms over eastern West Virginia.

Flooding was reported on a few roads in DC, including the 1200 Block of Olivet Road Northeast, near the intersection of East Capitol Street Southeast and Benning Road Southeast. Flooding was also reported on US-1 Rhode Island Avenue Northeast near the intersection of Brentwood Road NE and 13th Street NE.

An upper-level trough was overhead while a weak boundary was stalled nearby. Plenty of moisture around high pressure over the Atlantic led to the development of showers and thunderstorms. With slower storm motion, this led to instances of flooding.

A supercell thunderstorm spawned a brief EF1 tornado just north of Bowie, MD in Prince Georges County late on Tuesday afternoon July 5th, 2022, between 5:31 and 5:34 PM EDT. This supercell spawned along the Howard/Montgomery County line as a result of a remnant mesoscale convective vortex moving through the region which had moved through the Ohio Valley earlier in the day . It evolved into a cluster of cells initially before splitting off into an individual supercell that would develop rotation as it moved out of southeastern Montgomery County into northwestern Prince Georges County. The tornado caused extensive tree damage in the Somerset subdivision just north of Bowie, MD. There was also one instance where a tree had fallen on top of a residence near the intersection of Stafford Lane near Saber Lane . However, there were several other trees down in the area outside of the more concentrated tornadic damage, particularly along Buckingham Drive perpendicular to White Marsh Branch. At this location along Buckingham Drive, trees fell upon power lines, snapping several supporting utility poles. The tornado initially touched down around Tarragon Lane and tracked eastward over the Bowie High School Annex before tracking into the Somerset subdivision , where the majority of the damage was observed. The tornado would then lift just before reaching southern portions of Whitemarsh Park.

A supercell thunderstorm spawned a brief tornado just north of Harwood , Maryland (4 miles southwest of Londontowne) in Anne Arundel County late Tuesday afternoon July 5th, 2022, between 5:55 and 5:56 PM EDT. This supercell originally developed along the Howard/Montgomery County line as a result of a remnant mesoscale convective vortex (MCV) moving through the region which had moved through the Ohio Valley earlier in the day . It evolved into a cluster of cells initially before splitting off into an individual supercell that would develop rotation as it moved out of southeastern Montgomery County into northwestern Prince Georges County. The cell dropped a tornado earlier in the afternoon near Bowie, and would then cycle to produce the second tornado in Harwood. A broadcast media partner provided video and eyewitness evidence of a brief spin -up tornado while located at the intersection of Birdsville Road and MD-2 Solomons Island Road. This individual noted that the tornado was located just to their north in an open field and was on the ground for about one minute.

Storm Data and Unusual Weather Phenomena - July 2022

Location	Date/Time	Deaths & Injuries	Property & Crop Dmg	Event Type and Details
----------	-----------	-------------------	---------------------	------------------------

An outbreak of significant severe weather occurred during the afternoon and evening hours of Tuesday, July 12th, 2022. An unseasonably strong cold front interacted with a high instability airmass to result in several bowing lines of thunderstorms, which maintained their organization and intensity due to strong atmospheric wind shear. Swaths of widespread damaging winds were observed, much of which was considerable. A couple of tornadoes were also confirmed, along with some significant hail. A wind gust of over 100 MPH was measured in one of the most powerful storms over eastern West Virginia.

<p>An outbreak of significant severe weather occurred during the afternoon and evening hours of Tuesday, July 12th, 2022. An unseasonably strong cold front interacted with a high instability airmass to result in several bowing lines of thunderstorms, which maintained their organization and intensity due to strong atmospheric wind shear. Swaths of widespread damaging winds were observed, much of which was considerable. A couple of tornadoes were also confirmed, along with some significant hail. A wind gust of over 100 MPH was measured in one of the most powerful storms over eastern West Virginia.</p>

A powerful storm tracked across southern Hampshire County on July 12th, 2022, producing a 23-mile long by 9-mile wide swath of extensive tree and property damage. The vast majority of this damage was associated with a macroburst as a bowing storm and associated rear-inflow jet tracked across the county. Winds within this 9-mile wide swath were estimated to be between 60 and 105 MPH.				
Within Hampshire County, sporadic tree damage was noted as far west as Purgitsville, but more appreciable damage began in the vicinity of the South Branch of the Potomac River several miles to the south of Romney, West Virginia. Significant tree damage associated with the bowing portion of the storm extended south of Arnold Farm Lane along CR-8 South Branch River Road and CR-6 Trough Road for about four miles. Within this stretch of damage, entire corn fields were leveled just to the south of Trough View Road . Dozens of trees were blown down in this area, as well. Wind gusts were estimated to be as high as 70 MPH in this section of the county.

A powerful storm tracked across southern Hampshire County on July 12th, 2022, producing a 23-mile long by 9-mile wide swath of extensive tree and property damage. The vast majority of this damage was associated with a macroburst as a bowing storm and associated rear-inflow jet tracked across the county. Winds within this 9-mile wide swath were estimated to be between 60 and 105 MPH.				
The storm progressed into the valley between Nathaniel Mountain and Short Mountain between about 3:43 and 3:53 PM EDT. Extensive tree damage was observed throughout this valley over a several mile long swath extending from north to south. The most extensive damage was observed just north of Kirby. Hundreds of trees were either snapped or uprooted, and a high level of defoliation was observed on any trees that remained due to wind-driven hail. Two-inch diameter hail was observed near Kirby, and accumulating golf ball size hail was observed near Hampshire Gas Company off of Grass Lick Road . Significant hail damage occurred at Hampshire Gas Company. A personal weather station measured a wind gust of 89 knots (102 MPH) just to the north of Hampshire Gas Company, while a weather station on site at Hampshire Gas Company failed in the wind-driven hail. The maximum level of defoliation was noted in the vicinity of where the 102 MPH gust was recorded and where the accumulating golf ball size hail was observed. Most of this area likely observed winds of 75 to 90 MPH, with winds in excess of 100 MPH being localized to near the sensor immediately in the lee of Nathaniel Mountain.

Winds within this 9-mile wide swath were estimated to be between 60 and 105 MPH.				
After the storm progressed over Short Mountain, it moved eastward toward Delray. Within the valley east of Short Mountain, sporadic tree damage was noted as far north as around 4 miles north of Delray, but much more extensive tree damage was observed from Delray southward to Rio (a 5-mile wide swath). This damage was maximized in a community to the west of WV-29 Delray Road about 1.5 miles south of Delray, with extensive damage noted along both Wild Dog Pass and Buck Run. Hundreds of healthy trees were snapped and uprooted within this neighborhood, some of which fell on structures and vehicles. Some roads in this neighborhood were inaccessible due to downed wires and snapped power poles.				
Extensive damage was also noted at a residence just to the south of Wild Dog Pass along WV-29 Delray Road. A load bearing pillar of the house was blown out by the wind, and a large enclosed trailer was blown up and over a vehicle, then about 100 yards down a hill. A nearby barn was blown over, as well, and another nearby home lost part of its roof. Winds in this area were estimated to be between 80 and 100 MPH.

<p>A powerful storm tracked across southern Hampshire County on July 12th, 2022, producing a 23-mile long by 9-mile wide swath of extensive tree and property damage. The vast majority of this damage was associated with a macroburst as a bowing storm and associated rear-inflow jet tracked across the county. Winds within this 9-mile wide swath were estimated to be between 60 and 105 MPH.</p> <p>The storm progressed out of the North River Valley and crossed another range of mountains before progressing into the Cacapon River Valley . Here, numerous trees were snapped and uprooted in Yellow Spring, Capon Lake, and Capon Springs.</p> <p>An outbreak of significant severe weather occurred during the afternoon and evening hours of Tuesday, July 12th, 2022. An unseasonably strong cold front interacted with a high instability airmass to result in several bowing lines of thunderstorms, which maintained their organization and intensity due to strong atmospheric wind shear. Swaths of widespread damaging winds were observed, much of which was considerable. A couple of tornadoes were also confirmed, along with some significant hail. A wind gust of over 100 MPH was measured in one of the most powerful storms over eastern West Virginia.</p>
