A tree branch was reported down in the 4900 block of 36th Street Northwest.

A strongly unstable airmass in a moderately sheared environment squeezed between two fronts resulted in several clusters of destructive thunderstorms. The most intense thunderstorms propagated north to south along a stalled front dividing very unstable air near and west of Interstate 95, from notably more stable air closer to the Chesapeake Bay.

The event was unusual not only because of the intensity of the thunderstorms, but because they moved in a north to south direction, even propagating south-southwestward at times.

The worst of these storms avoided the District of Columbia, though some minor wind damage was reported in Northwest.

The water level along Rock Creek at Sherrill Drive rose above flood stage, cresting at 7.16 feet at 1:45 AM EST. Water reached several portions of the Valley Trail between picnic areas 7 and 10.

A nearly stationary boundary oriented from north to south set up over the area. Showers and thunderstorms developed along the boundary. Storm motion was also north to south, which allowed for storms to train over the same locations, resulting in isolated instances of flooding.

A severe thunderstorm spawned a brief tornado between 8:42 and 8:47 PM EDT Wednesday evening, June 8th, 2022, near Mechanicsville in Saint Mary's County, Maryland. The origin of this severe thunderstorm was the result of a cell merger of two separate thunderstorms that approached Saint Mary's County: one crossing eastward over the Potomac River from near Quantico in Virginia moving toward Charles County, Maryland; and the other one crossing northeast over the Potomac River near Colonial Beach. The cells merged over Charles County between La Plata and Dentsville, then proceeded due east toward northern Saint Mary's County where the tornado occurred.

The severe thunderstorm damaged over two dozen trees and large branches in an approximately three mile radius of the intersection of MD-5 Point Lookout Road and MD-235 Three Notch Road. Most of this damage was sporadic and isolated in areal extent, but included tree trunk snaps and uproots, with estimated wind speeds between 60 and 70 MPH based on the observed tree damage. However, there were two areas of more concentrated damage that helped lead to the determination of a tornado in this area of southern Maryland.

The tornado initially touched down around an enclave of residential houses 200 yards southwest of the intersection of MD-5 and MD-235. Here, there was a mix of about a dozen uprooted and trunk snaps of both hardwood and softwood trees. One of the trees fell onto the roof of a residence, causing roof damage; fortunately, there were no injuries despite a resident being inside the home when it fell. The trees fell to the north, east, southeast, east, west, and northwest. Due to the localized but prolific damage in this enclave, wind estimates are up to 85 MPH. It is believed that the tornado went right over this enclave of residences due to the random direction of tree falls.

The tornado may have lifted as it moved to the east-northeast. However, tornadic damage was noted about 3 miles further east along Delabrooke Road, where a chaotic mix of downed trees and branches were observed on both sides of the 40900 block in a deeply forested area. Residents in this area received the mobile phone alert before the damage occurred, and also reported half dollar size hail.

Finally, a certified NWS SKYWARN Spotter filmed a video from MD-235, showing an earthward extension of the cloud base. Rotation was noted within this lowering.

Two trees blew down on Wolf Gap Road near the West Virginia state line.				
<p>A strongly unstable airmass in a moderately sheared environment squeezed between two fronts resulted in several clusters of destructive thunderstorms. The most intense thunderstorms propagated north to south along a stalled front dividing very unstable air near and west of Interstate 95, from notably more stable air closer to the Chesapeake Bay.</p> <p>The event was unusual not only because of the intensity of the thunderstorms, but because they moved in a north to south direction, even propagating south-southwestward at times.</p>
