2024 Flood Potential Outlook Missouri River Basin

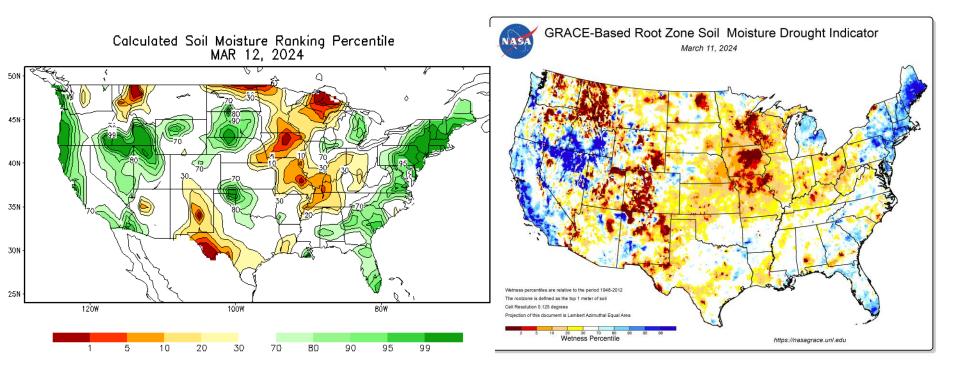

March 14, 2024

CHANCE OF REACHING FLOOD STAGE IN 2024 AS COMPARED TO HISTORICAL MUCH OF THE MISSOURI BASIN HAS A REDUCED RISK FOR FLOODING

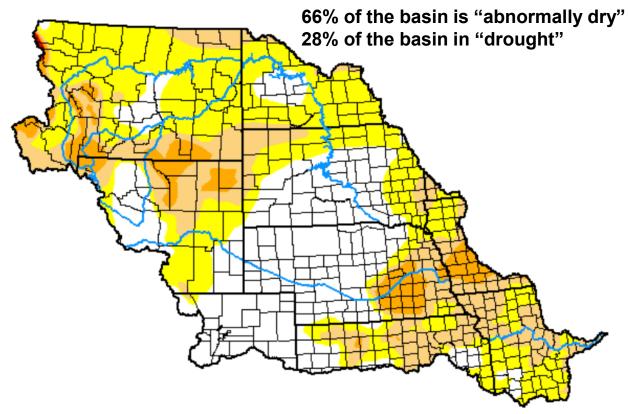

MISSOURI BASIN: SOIL MOISTURE CONDITIONS

Soil moisture is better than last year in portions of the northern plains. But, in general, soils in the Missouri River basin are dry.

MISSOURI BASIN: DROUGHT CONDITIONS

March 12, 2024 (Released Thursday, Mar. 14, 2024) Valid 8 a.m. EDT

Drought Conditions (Percent Area)

	None	D0-D4	D1-D4	D2-D4	D3-D4	D4
Current	33.84	66.16	28.22	7.21	0.08	0.00
Last Week 03-05-2024	34.19	65.81	28.14	7.12	0.08	0.00
3 Month s Ago 12-12-2023	61.42	38.58	20.00	10.57	2.47	0.56
Start of Calendar Year 01-02-2024	53.56	46.44	19.40	8.57	1.61	0.03
Start of Water Year 09-26-2023	57.86	42.14	31.19	17.17	5.73	0.70
One Year Ago 03-14-2023	22.97	77.03	51.04	24.19	8.58	1.62

The Drought Monitor focuses on broad-scale conditions. Local conditions may vary. For more information on the Drought Monitor, go to https://droughtmonitor.unl.edu/About.aspx

MISSOURI BASIN: FROST DEPTHS FROZEN GROUND NOT A CONCERN SOUTH OF mid-SOUTH DAKOTA

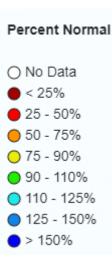

MISSOURI BASIN: Mountain Snowpack As of 13 March 2024

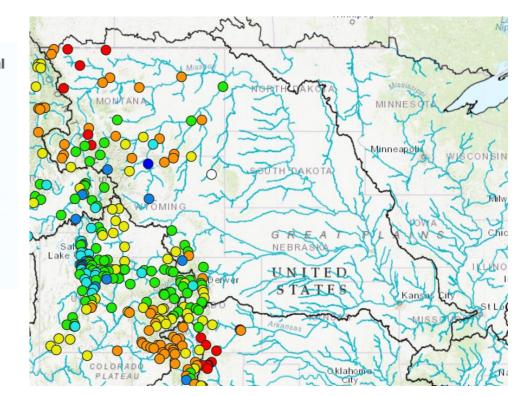

Mountain snowpack running well below average in the northern Rockies;

Near average in the Platte River system

Mountain Runoff Volume April-September Percent of Normal

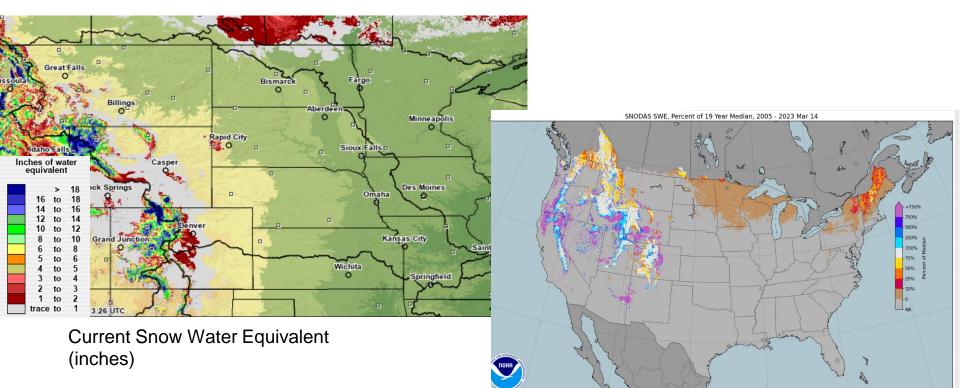

Mountain runoff volume projected to be below normal (per 01 March 2024 Outlook)

- Upper Missouri above Ft. Peck: 80%
- Yellowstone: 92%
- North Platte: 94%
- South Platte: 76%

Plains Snowpack as of 14 March 2024

Plains snow pretty much non-existent

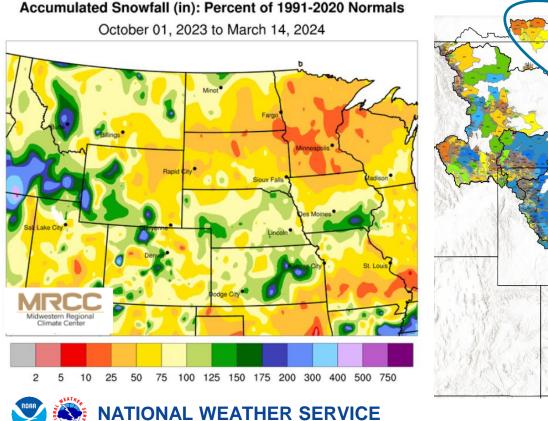

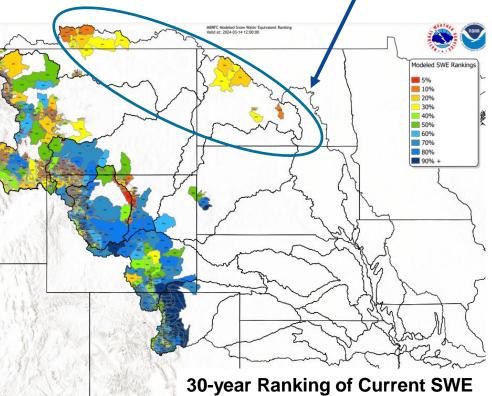

SNODAS Modelled SWE in % of 19-year Median Building a Weather-Ready Nation // 8

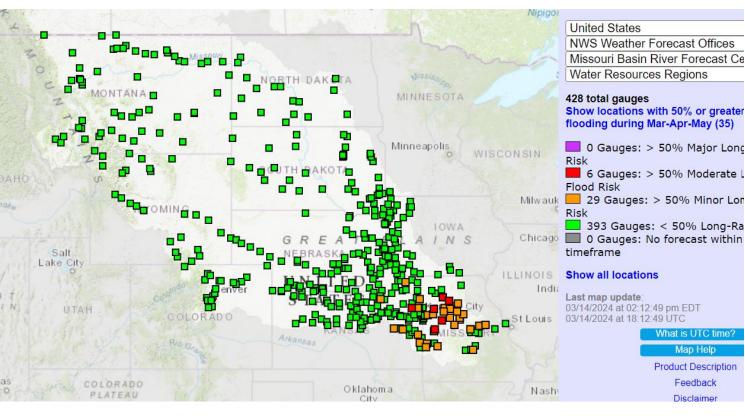

Plains Snowpack Compared to "Normal"

Lower third of all years

Locations Expected to Flood Next 90 days (thru mid-June)

Minor to moderate flooding likely in the lower portion of the basin.

The Missouri River itself could see episodic, on-again, off-again, minor flooding downstream of KC to the mouth at St. Louis

Flood Potential Outlook: Summary Points

- Overall, spring flood risk is normal to lower-than-normal.
- Mountain snowpack is well-below average in north, near-average in south. We still have roughly 15% of snow accumulating period remaining.
- Plains snowpack is limited to CO and WY. Plains snowpack will not be a player this Spring.
- Soils thawed south of extreme northern South Dakota. Frozen soils may enhance flood risk across North Dakota and Montana.
- Ice is rotting in place, or has already moved out of much of the plains. Ice jam break-up flooding risk is low. Where river ice remains, risk for ice jamming remains.
- Flood Potential mountains: No flooding currently expected.
- Flood Potential northern plains: No flooding currently expected.
- Flood Potential lower basin: Episodic minor-to-moderate level flooding likely in the lower portion of the basin (eastern KS, MO) due to Spring-time thunderstorm activity.
- Flood Potential Missouri River mainstem: Minor flooding likely downstream of KC, again due to thunderstorm activity. As we move further into Summer, minor flooding in the Nebraska City thru Atchison reach of the Missouri River cannot be ruled out.
