- Without observations of rip currents we can not verify rip current forecasts for beach safety.
- 2004 NWS-Sea Grant Rip Current Technical Workshop:

“A pilot program should be implemented to monitor rip currents so as to reduce the hazard they pose to the public.”

# Stakeholders: A Team Approach

● Participating Beaches

## Wave Angle Variations

### Normal to Near Normal

High probability for near normal case

Strength, spacing, and duration dependent on wave height

©The COMET Program

## Wave Angle Variations

### Small Incidence with Structures

Main rip current on wave incident side of structure

Smaller rip current on "shadow" side of structure

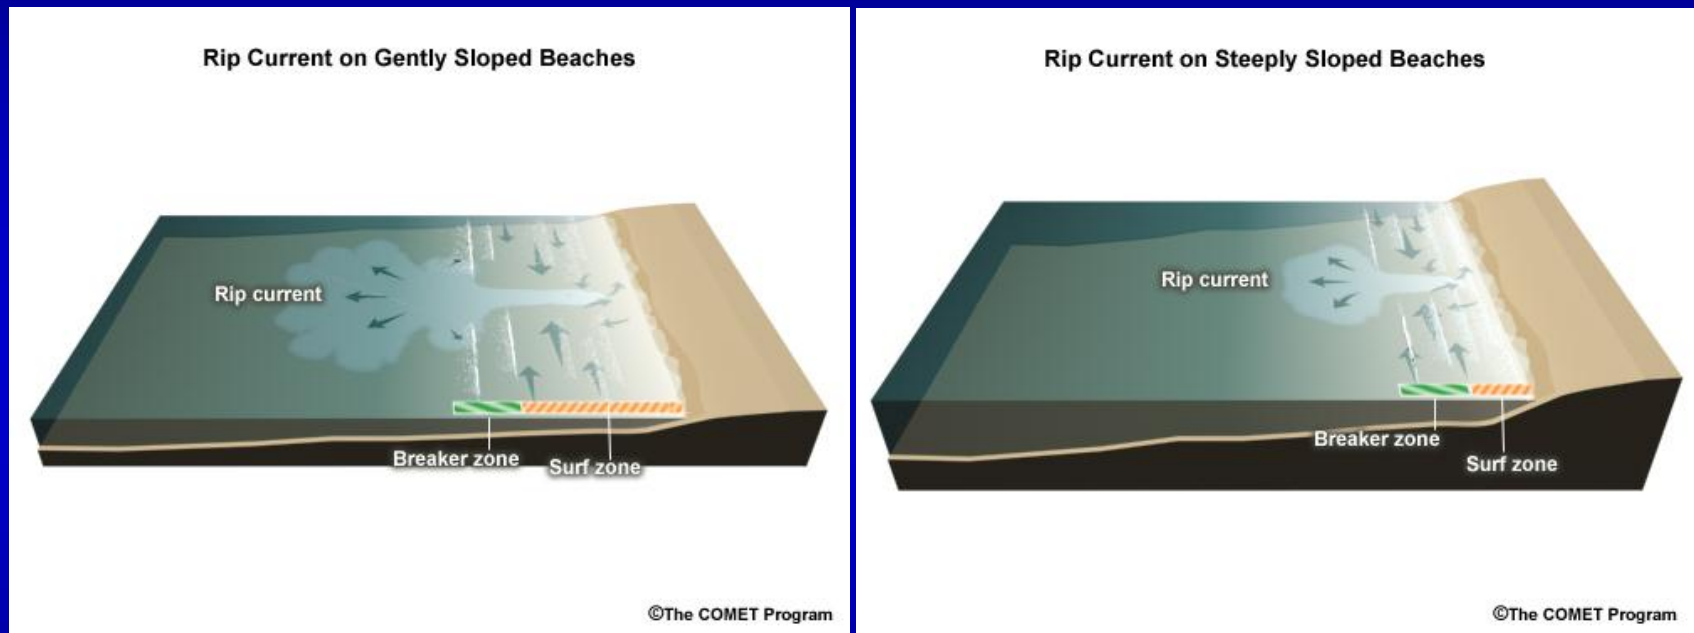

©The COMET Program

Near-normal incoming waves will most likely cause rip currents at beaches with no permanent outcroppings.

Permanent outcroppings along the shoreline, such as jetties or piers, can cause rip currents, especially with oblique wave angles.

Wave breaks when wave height is  $> \sim 0.8$  times the water depth.

Rip currents are more often seen at beaches with mild slopes instead of steep slopes, because this affects the surf zone width and therefore the amount of water transport.

## Tidal Modulation of Rip Currents

©The COMET Program

Changes in water level via tides or (in the Great Lakes) seiches or seasonal water level variations can provoke rip currents through surf zone with changes and increase channeling through sandbars.

## Rip Current Monitoring Report

Beach Name: Daytona Beach	Report Date: 2012-07-13 (yyyy-mm-dd)	Report Time: Hour : Minute AM/PM
Surf Height (Feet): [Examples: 1 or 2-3]	Surf Zone Width (Yards): [Example: 25]	
Incoming Wave Direction: Select Wave Direction	Tide: Select Tide	
Rip Observed? Yes	Rip Currents Activity: High	
Number of Rip Rescues: [Example: 3]	Water Temperature (°F): [Example: 72]	
Comments (Rip pull distance, cuts in bars, longshore current, # of waves per set, # of rips):		
<input type="text"/>		
Lifeguard: <input type="text"/>		
Required: Please type the word "eight" in the box <input type="text"/>

**4** Supplemental Data Added

Analyze Observations

# Jacksonville Beach Rip Current Report

LOCATION:	Jacksonville Beach
OBSERVATION TIME (L):	2012-07-17 12:05 PM
SURF HEIGHT (FT):	2-3
SURF ZONE WIDTH (YDS):	80
WAVE DIRECTION:	E
WATER LEVEL CATEGORY:	Falling
RIP CURRENT OBSERVED (Y/N):	Yes
RIP CURRENTS ACTIVITY:	High
RIP RESCUES:	5
WATER ATTENDANCE:	High
COMMENTS:	Extremely hazardous conditions persist throughout area. Deep sloughs and powerful feeder currents are creating unusually strong rip current conditions.
LIFEGUARD:	Taylor Anderson

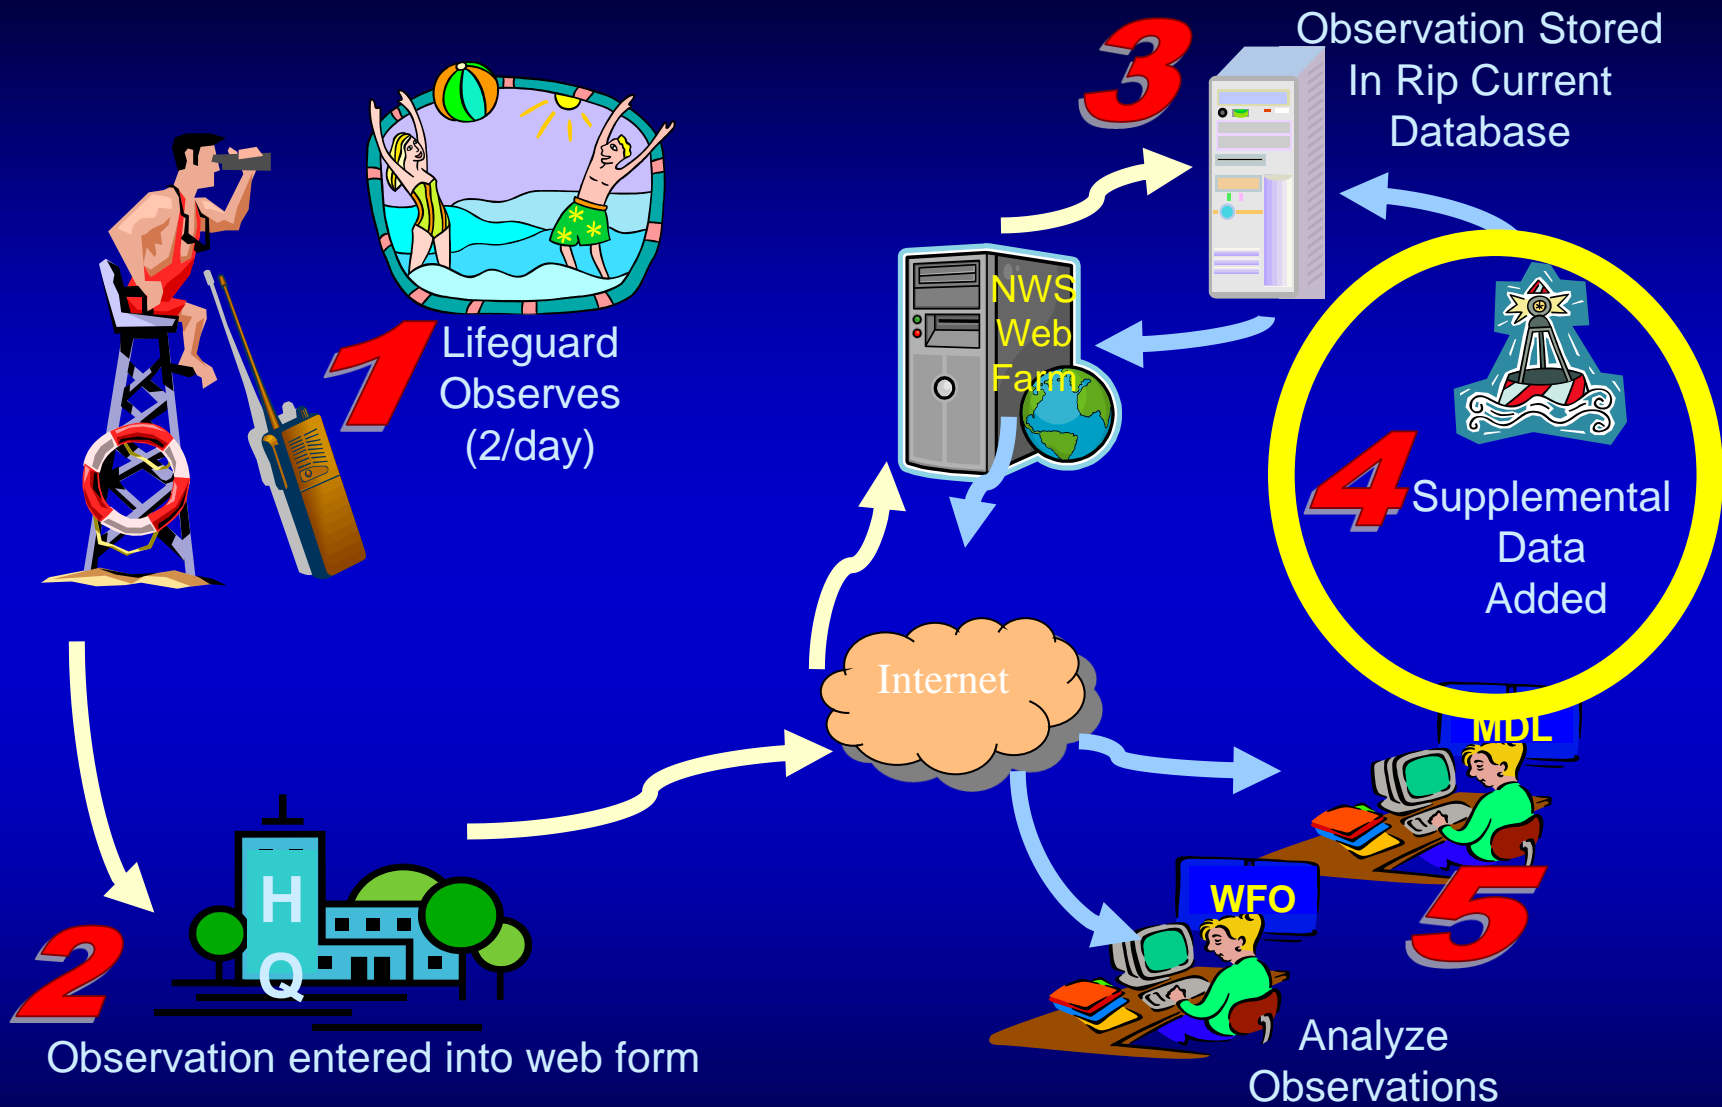

## Rip Current Activity Level

-- A subjective assessment of activity of rip currents that could impact swimmers at a particular beach. It encompasses aspects of both the strength and number of rip currents

- **High Activity:** Many, strong rip currents
- **Medium Activity:** Many, weak rip currents
- **Low Activity:** A few weak rip currents
- **No Activity:** No rip currents

Stored Obs/Forecast Parameters (when available):

- Wave Ht/Pd/Dir
- Swell Ht/Pd/Dir
- Tide Level
- Water Temperature

Models:

WaveWatch III

Coastal Data Information Program (CDIP)

Great Lakes Coastal Forecasting System (GLCFS)

Corresponding model data and station observations are paired with the lifeguards reports for later analysis

Surf (ft)	1.5 - 2.0	2.0 – 3.0	3.0 - 5.0	Preventive warnings
Tide level				
Low	2	5	3	1270
Mid	3	9	0	456
High	0	4	1	49
Sub-total	5	18	4	1775

**Encinitas Lifeguards safety service record (7/1-8/30/2008)**

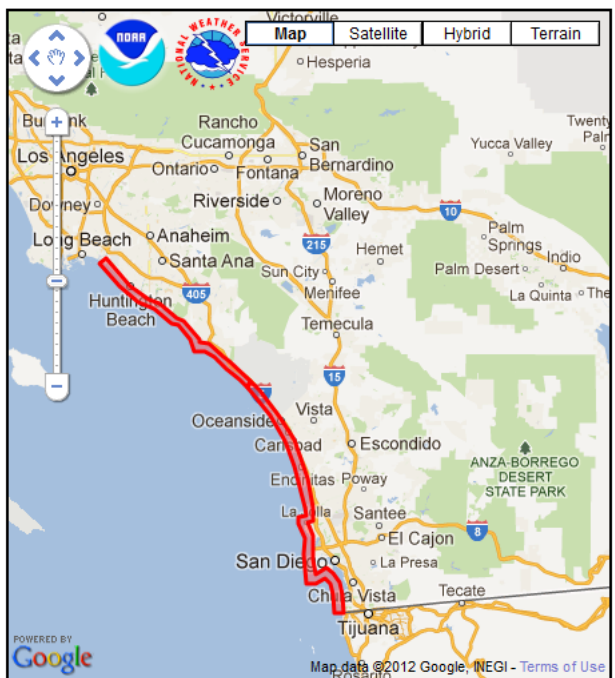

**Many beach rescues occur in 2-3 ft waves (WFO-SGX).**

## Rip Current Hazard Map

\* THE FOLLOWING INFORMATION APPLIES WHEN FORECAST RIP CURRENT POTENTIAL IS "LOW": DUE TO HIGHLY VARIED COASTAL TOPOGRAPHY DANGEROUS RIP CURRENTS ARE ALWAYS A POSSIBILITY ALONG THE SOUTHERN CALIFORNIA COAST...AND SWIMMERS ARE URGED TO USE CAUTION AT ALL TIMES AND SWIM NEAR A LIFEGUARD.

**Orange County Beaches**  
FORECAST FOR TUE JUL 10.  
**Rip Current Potential: HIGH. VERY STRONG CURRENTS AND DANGEROUS SWIMMING CONDITIONS ARE EXPECTED.**  
  
Surf Height: 2 TO 4 FEET.  
Water temperature: 60 TO 66 DEGREES.  
Remarks: OCCASIONAL SETS TO 5 FEET ON SOUTH AND SOUTHWEST FACING BEACHES.  
Outlook: 2 TO 4 FEET.

**San Diego County Beaches**  
FORECAST FOR TUE JUL 10.  
**Rip Current Potential: HIGH. VERY STRONG CURRENTS AND DANGEROUS SWIMMING CONDITIONS ARE EXPECTED.**  
  
Surf Height: 2 TO 4 FEET.  
Water temperature: 60 TO 66 DEGREES.  
Remarks: OCCASIONAL SETS TO 5 FEET ON SOUTH AND SOUTHWEST FACING BEACHES.  
Outlook: 2 TO 4 FEET.

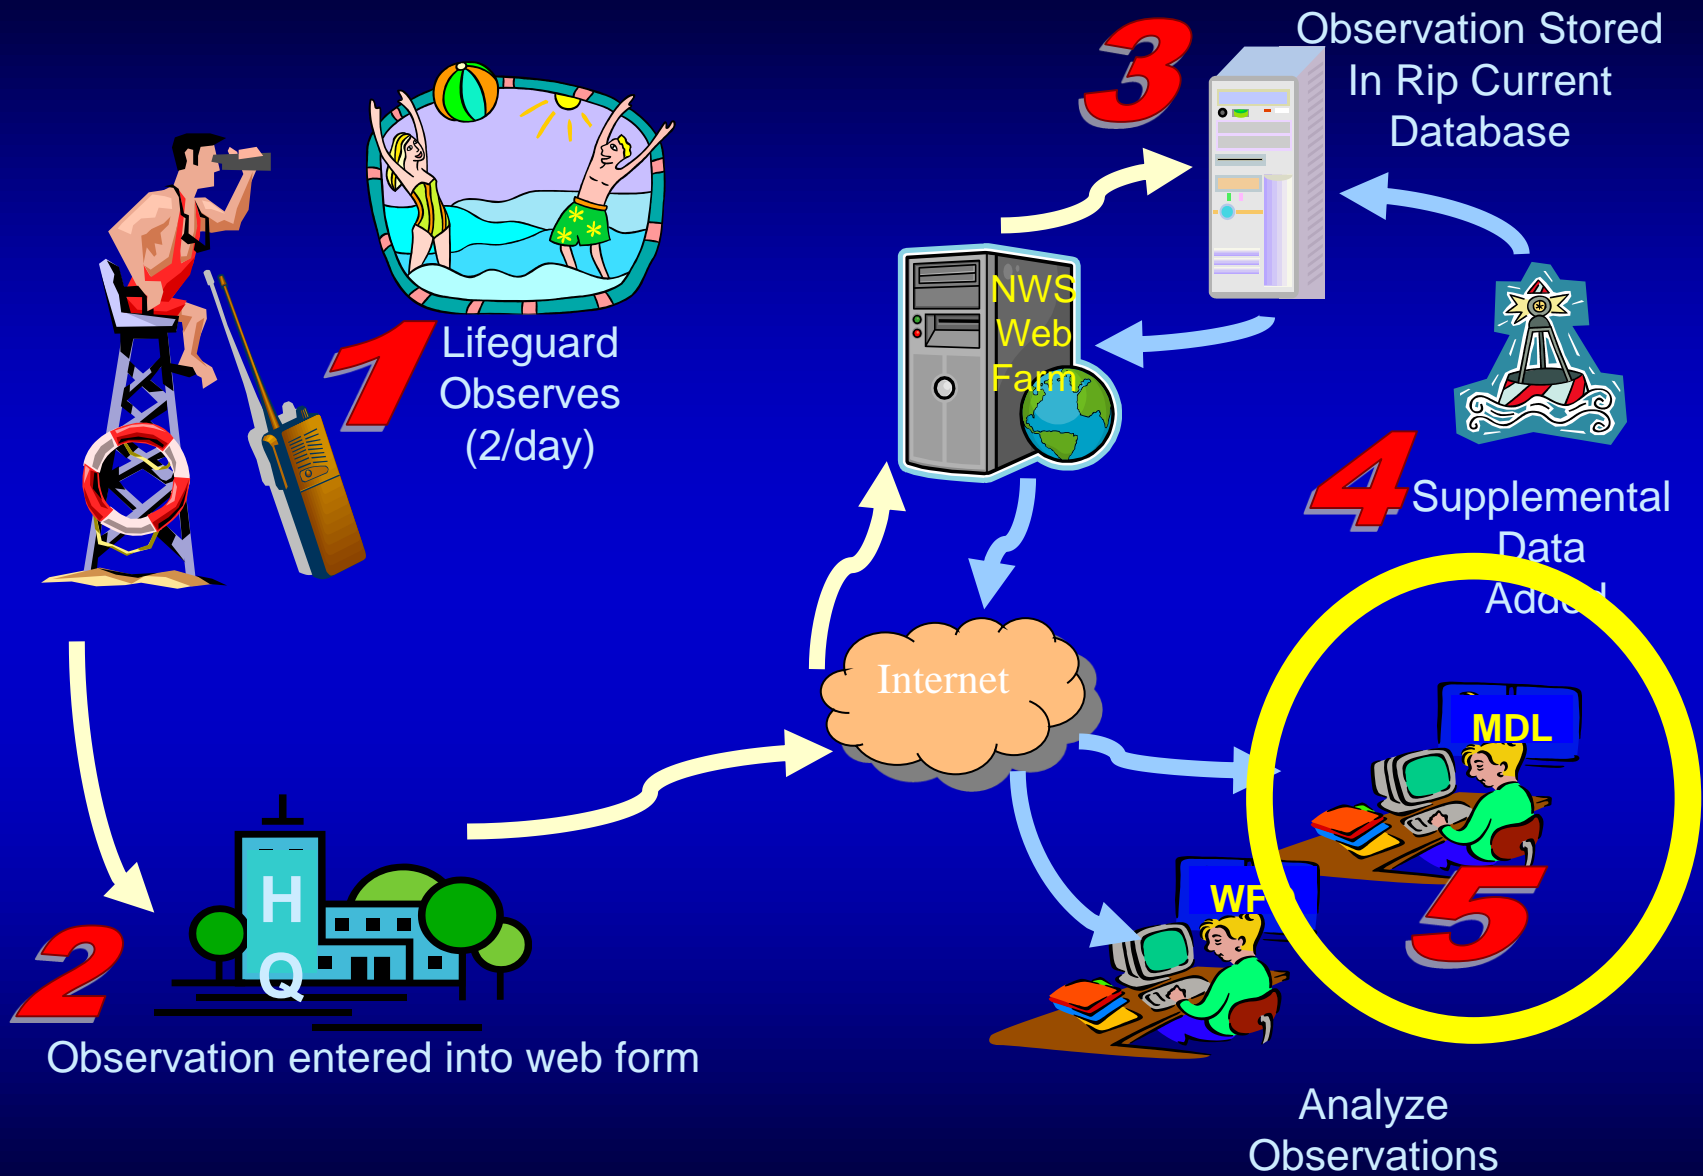

This map shows the rip current safety conditions for Orange and San Diego counties.  
Public [comments](#) and [suggestions](#) are encouraged or take this [user survey](#).

**Legend:**  
 Low Rip Current Risk High Rip Current Risk

[Alternate Text Product - LAXSRFSGX](#)  
[NWS Rip Current Page](#)

“This ongoing project is a good example of how a clear goal and good communications between HQ, WFO, emergency partners, and media can work and be successful for a common cause.”

Noel Isla, WFO-SGX

# Rip Current Forecasting Tools (Wu)

Incorporating input from key rip current forcing factors:

- Significant Wave Heights
- Coastal Winds
- Peak Wave Periods
- Total Water Levels

Other factors to take into account:

- beach orientation
- hot weather
- beach sand characteristics

Model types tested:

- Check List Tables
- Parametric Models
- Regression Models

# Automated Local Rip Current Guidance

$$RI = A * H + B * T - C * h$$

H=Surf Zone wave ht; T=Surf Zone Wave Pd.; H = Water Level  
A, B, C = empirically-derived coefficients (e.g., beach slope and orientation)

None or Very Low: RI < 1.0      Low: 1.0 ≤ RI < 1.1  
Medium: 1.1 ≤ RI < 1.2      High: RI ≥ 1.2

Mouse hovers at (8/19/2011 10:28, 1.56).

Daytona Beach, Florida

**Rip Current Episode** -- An extended period of medium to high rip current activity at a beach lasting from a few hours to several days

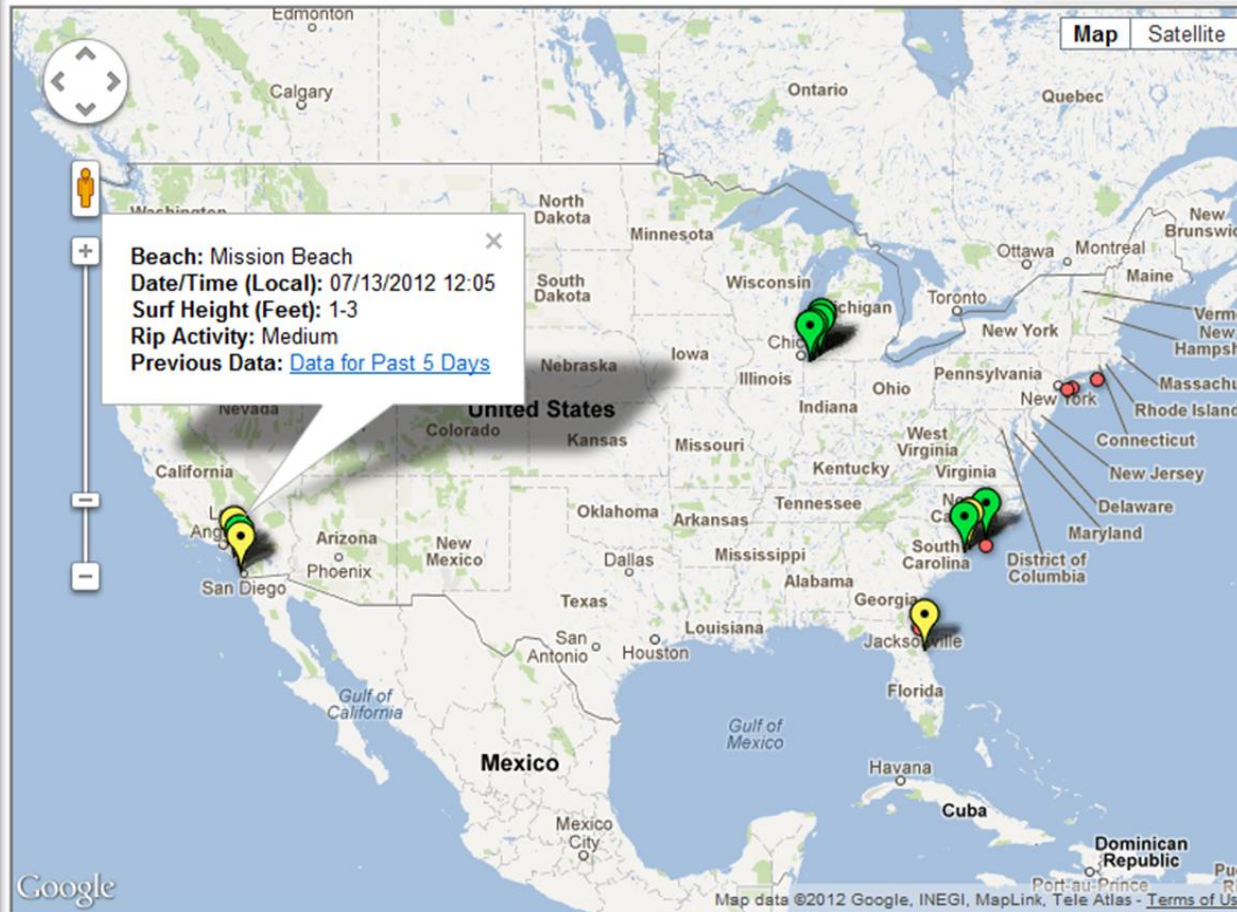

# MDL Automated Local Rip Current Guidance Skill Scores

Summer 2011 at Daytona Beach, FL

	POD (Probability of Detection)	FAR (False Alarm Rate)	CSI (Critical Success Index)
Hurricanes Irene & Katia 08/24 – 09/15	0.71	0.26	0.67
Summer 2011 05/20-09/25	0.65	0.27	0.63

## Rip Current Monitoring System

Rip Current Monitoring System - by U.S. lifeguards and coastal marine Weather Forecast Offices.

Experimental MDL Rip Current Activity Level page – Lifeguard Rip Activity reports mapped to beaches.

Placemarks in the map above show the location of lifeguard-supplied rip current observations. The placemark color indicates the level of rip current activity (see legend below). Clicking on the placemark will show the most recent rip current observation. To see rip current observations for the past 5 days, click on the link in the placemark balloon. Beaches with no recent observations are shown as a dot.

## Short-Term Goals

1. Provide WFO's and partners with instant access to past lifeguard reports, supplemental data, and automated local rip current guidance.
2. Assist WFO's with setting up rip current collaboration with local lifeguard agencies.
3. Send rip current reports/alerts to WFO's via AWIPS.

# Long-Term Goals

1. Develop beach-specific rip current forecasts and diagnostics.
2. Create methodology that can be shared with WFO's to develop their own formulas.
3. Share lifeguard reports and rip current diagnostics/forecasts with the public.

-- Working towards an Impacted-Based Decision Support Services approach for rip current hazards.
