From: Tim McClung
 Chief, Science Plans Branch
 Office of Science and Technology

Subject: Amended: Changes to GFS-based Model Output Statistics (MOS)
Guidance: Effective January 14, 2015

Amended to change the implementation date from Wednesday, January 7, 2015
to Wednesday, January 14, 2015.

On or about Wednesday, January 14, 2015, beginning with the 1200
Coordinated Universal Time (UTC) model run, the NWS Meteorological
Development Laboratory (MDL) will implement a refresh of the Global
Forecast System (GFS)-based Model Output Statistics (MOS) guidance to
coincide with the GFS model upgrade. These changes will also impact the
Localized Aviation Model Output Statistics (MOS) Program (LAMP) products
beginning with the 1600 UTC cycle.

MDL has created a comparison webpage for the short-range and extended-
range GFS-based MOS text bulletins. The following link will be active
until on or about January 14, 2015:

http://www.mdl.nws.noaa.gov/~mos/mos/gfsmos_eval/moscomp.php

This update will include the following changes to GFS-based MOS text and
Binary Universal Form for the Representation of meteorological data (BUFR)
products:

Updated cool season equations for the short-range (days 1-4) MOS text and
BUFR messages from the 0000, 0600, 1200 and 1800 UTC model runs. The
updates will include the following elements:

Daytime Maximum and Nighttime Minimum Temperature
2-meter Temperature
2-meter Dewpoint Temperature
Wind Speed
Wind Direction
Conditional Probability of Freezing Precipitation
Conditional Probability of Frozen Precipitation
Precipitation Type Best Category

24-hour Categorical Snowfall Amount

Updated cool season equations for the extended-range (days 1-7) MOS text and BUFR messages from the 0000 and 1200 UTC model runs. The updates will include the following elements:

Daytime Maximum and Nighttime Minimum Temperature
2-meter Temperature
2-meter Dewpoint Temperature
Wind Speed
Wind Direction
Conditional Probability of Freezing Precipitation Occurring (12-hour)
Conditional Probability of Snow Occurring (12-hour)
Conditional Probability of Rain/Snow Mix Occurring (12-hour)
Precipitation Type Best Category (12-hour)
24-hour Categorical Snowfall Amount

Updated cool season maximum and minimum temperature equations for all cycles of the short-range and extended-range MOS COOP text message.

Updated cool season equations for the probability of precipitation occurrence on the hour (PoPO) and the probability of precipitation occurrence in a 3-h period (PoPO3) for all cycles of the short-range (days 1-4) MOS BUFR message.

Due to changes in reporting frequencies at some observing sites, some MOS stations no longer report sufficiently and some stations now have sufficient reports for statistical calibration. As a result, NWS will remove 15 stations and add 339 stations to the short-range and extended-range GFS MOS text bulletins (known by their Advanced Weather Interactive Processing System (AWIPS) identifiers (IDs) MAV and MEX) and BUFR messages. The NWS will change the ID used for one station in the GFS MOS text bulletins and BUFR messages: Tazewell City, VA will change from K6V3 to KJFZ. This station has been included in the add and remove counts stated above.

NWS will remove 38 stations and add one station to the GFS MOS marine text message (known by the AWIPS ID MMG) and BUFR message.

NWS will remove 152 stations and add 197 stations to the GFS MOS River Forecast Center (RFC) Standard Hydrometeorological Exchange Format (SHEF) message (known by its AWIPS ID FTP).

NWS will remove three stations from the short-range and extended-range GFS MOS Canadian text messages.

NWS will remove 1,468 stations from the short-range and extended-range GFS MOS Cooperative Network (COOP) messages. These removed stations have closed, stopped reporting, or do not contain sufficient cases to develop a stable equation. COOP sites influence the Gridded MOS analysis for maximum and minimum temperature. The removal of these COOP sites is not expected to adversely impact the quality of the Gridded MOS maximum and minimum temperature guidance.

Stations will be added to existing regional equations for the following elements in the short-range and extended-range MOS text and BUFR products:

- Sky Cover
- Probability of Precipitation
- Quantitative Precipitation
- Probability of a Thunderstorm
- Conditional Probability of a Severe Thunderstorm
- Ceiling Height
- Visibility Obstruction to Vision

These changes will slightly alter the format of the MAV, MEX, MMG, and FTP messages because lines will be added or removed to accommodate the addition/removal of stations. The communication identifiers for the MOS text and BUFR products affected by these changes are shown in the tables below.

Due to a shorter sample of cool season retrospective model data being available for the 0600 and 1800 UTC cycles, users are advised that the MOS guidance for these cycles is not tuned as well to the new version of the GFS and may be somewhat degraded. In addition, guidance for Mesonet sites was not updated and as a result may be degraded. Until guidance for Mesonet stations can be re-developed, steps are being taken to reduce the influence of these sites on the Gridded MOS analysis for temperature and wind. Text-based MOS products are not produced for Mesonet sites.

A webpage outlining the station changes and equation updates is available at:

<http://www.nws.noaa.gov/mdl/synop/2014refresh/gfsmos2014.php>

This update will include the following changes to GFS-based LAMP text and BUFR products:

NWS will remove 15 stations from the LAMP text bulletin (known by the AWIPS ID LAV) and BUFR messages. In addition, the NWS will change the identifier used for one station in the LAMP text bulletins and BUFR messages: Tazewell City, VA will change from K6V3 to KJFZ. As such, K6V3 is included in the list of the 15 stations being removed, and KJFZ is being added to the text bulletin and BUFR messages. No other stations are being added to the LAMP text bulletins at this time.

The GFS MOS changes above will slightly alter the format of the LAV messages because lines will be added in response to additions or removals of GFS MOS guidance for some elements. The communication identifiers for the LAMP text and BUFR products affected by these changes are shown in the tables below.

A webpage outlining the LAMP station changes is available at:

http://www.nws.noaa.gov/mdl/gfslamp/docs/change_notice_Dec2014.shtml

Table 1: Communication Identifiers for the GFS-based MOS Public Text Products Affected by the Changes: For Air Force MOS messages with WMO

headers FOUS30 and FEUS30, FXX = F01...F29.

WMO Heading (Short Range)	AWIPS ID	WMO Heading (Extended Range)	AWIPS ID
