ACKNOWLEDGMENTS

To the U. S. Navy and to the Office of the U. S. Navy Representative at the National Weather Records Center (NWRC) for their intense interest and support given to the collection and processing of these wind data; to Mr. Leslie Smith, formerly Director, NWRC, for encouragement; to Mr. James Roddy for making the necessary electronic data processing machine programs; to Morton Bailey and Nancy Mauldin, who assembled the tabulations; to Lucille Gamache, who made the typescript; and to all other members of the staff of the NWRC who have contributed to this work.

UPPER WIND DISTRIBUTION STATISTICAL PARAMETER ESTIMATES

Harold L. Crutcher
National Weather Records Center, Asheville, N. C.

1. INTRODUCTION

The use and importance of upper-air wind data continue to increase. One reason is the growing and spreading knowledge of how to use the data more efficiently. Another reason is the urgency created by atomic and nuclear weapons, by rocket and satellite vehicles, and the economics of air transportation. Complete knowledge of all the relationships among the winds in space and time is lacking. Therefore, as new information is obtained its publication will enable others to advance their knowledge and to bridge those gaps now existing.

Several valuable publications are now available. The U. S. Navy [17] published in NAVAER 50-1C-526 a detailed summary of wind data over the United States of America and the Atlantic and Pacific Oceans, and presented [18] these data in graphical form in NAVAER 50-1C-528 and 529. The Navy publications and the British publications by Brooks and others on upper winds [2, 3, 9, 14] are mutually supplementary.

Several Meteorological Services now publish routinely the vector mean winds at selected station levels. Included in the publication of data for some stations, notably the British, are the standard vector deviations. In some, the scalar means are also published; these are the means of the speeds without regard to direction.

Many investigators have contributed to the extensive use of wind distribution parameters to answer problems facing meteorologists and associated scientists. Among the British, Canadian, and United States contributions are [1 - 16]. The present use of such data has been most strongly centered on the effects of wind on air transportation, radioactive "fallout", guided missile operation, and air pollution in general. Specific uses are given in the referenced papers.

2. PURPOSE

The purpose of this publication is to place in the hands of the user derived estimates of some statistical parameters of wind distributions over the Northern Hemisphere. Some of the uses of these derived parameters are discussed in the referenced papers and therefore are not repeated here.

Statistical parameters and derived values prepared from the original data are presented in the tables of this publication. These do not exhaust all of the possible relationships among the data, but they do present many of the wind data on a Northern Hemisphere basis that are urgently needed by the meteorologist, the forecaster, the climatologist, and the research worker in many fields of endeavor.

3. SOURCE OF DATA

The data used in this publication are on file at the National Weather Records Center in Asheville, N. C. These are a by-product of various projects accomplished at the Center, primarily those of the U. S. Navy. The general areas, period, and pressure levels of the data are as follows:

United States

4 Seasons: winter (Dec., Jan., Feb.), spring summer, fall
1 Period: 5 years, 1948 to 1953
5 Levels: 850, 700, 500, 300, 200 mb.

North Atlantic Area

4 Seasons: winter, spring, summer, fall
1 Period: 5 years, 1948 to 1953
5 Levels: 850, 700, 500, 300, 200 mb.

North Pacific Area

4 Seasons: winter, spring, summer, fall
1 Period: 5 years, 1948 to 1953
5 Levels: 850, 700, 500, 300, 200 mb.

Canadian, Arctic, and Caribbean Areas

4 Seasons: winter, spring, summer, fall
1 Period: 5 years, 1948 to 1953
4 Levels: 700, 500, 300, 200 mb.

Eurasian Area

4 Seasons: winter, spring, summer, fall

489601 O - 59 - 2

1 Period: 6 years, 1950 to 1956, inclusive
5 Levels: 850, 700, 500, 300, 200 mb.

Adjoining Areas

4 Seasons: winter, spring, summer, fall
X Period: variable
5 Levels: 850, 700, 500, 300, 200 mb.

For the Northern Hemisphere, reaching westward from about the Greenwich meridian to the coast of Asia, 5 years of record, 1948-1953, were used to produce the publication NAVAER 50-1C-526. The data from the 108 stations used in that project have been supplemented here by data for the same period from western Greenland, Canada, Mexico, the Caribbean area, Africa, and Eurasia.

Rawin observations were the primary source of data. Daytime observations, one per day, were used, as the balloons usually reach higher altitudes during the day. Thus, for the first two octants (0° longitude westward to 180°) the 1500 GMT soundings were used.

In a few cases, where rawin observations were initiated after the beginning of record, pibal data were used to fill out the observation record prior to the use of rawins.

Supplemental data for about 40 stations in the European, African, and Asian sections were obtained, also as by-products of projects effected at the Center. These data in general cover the period 1950-1956. Gaps exist in the record for some stations which have not been completed by scaling of values from upper-air charts. Where gaps have been filled, the methods used to provide "fill-in" data are those discussed in NAVAER 50-1C-526 and in unpublished sources available at the National Weather Records Center.

At the present time, data for the Northern Hemisphere for the periods specified previously are available only up to 200 mb. As data become available for higher levels, either directly from, or as a by-product of, a project, it is planned to issue such data in a supplemental publication.

4. STATISTICAL PARAMETER ESTIMATES

The estimates of the statistical parameters of the upper wind distribution are tabulated on pages — . Table 1 gives the symbols and definitions of the statistical parameters and the formulas used in computing the tabulated estimates. Table 2 provides the list of stations by geographic areas, by latitude, longitude, time of observation, period of record, and the pressure surfaces used. The stations are listed alphabetically in the table of contents.

5. FUTURE PLANS

The data presented here lend themselves to analysis on a hemispheric basis. In a separate project supported by the U. S. Navy, the U. S. Weather Bureau has initiated analysis of selected parameters over the Northern Hemisphere. Charts will be published by the Chief of Naval Operations as a part of the Navaer series.

Among those parameters initially selected for analysis are the isogons and isotachs of the vector mean wind, the standard vector deviation, the means and standard deviations of the zonal and meridional wind components. Cross-section analyses at selected meridians from the equator to the pole of the same parameters will be made.

Table 1. - Symbols and definitions of the statistical parameters and formulas used in computing the tabulated estimates.

Column	Symbol	Definition	Formula
1.	p	Pressure Surface, 850, 700 mb., etc.	
2.	J	Season (Initial Month) 12 is Winter, 03 is Spring.	
3.	$\bar{\theta}$	Direction of vector mean wind measured in degrees clockwise from North: 0° or 360° (N), 090° (E), 180° (S) and 270° (W).	= arctan $\bar{X}/\bar{Y}$, measured in degrees clockwise from North
4.	$\lvert\bar{V}\rvert$	Magnitude of vector mean wind.	= $\sum_{i=1}^{N} v_i/N$ where v_i is an individual wind vector; $\lvert\bar{V}\rvert$ is the magnitude of the vector mean wind.
5.	S_v	Standard Vector Deviation.	= $\left[\frac{N\Sigma(\lvert v_i\rvert)^2 - \lvert(\Sigma v_i)\rvert^2}{N(N-1)}\right]^{1/2} = \left[S_x^2 + S_y^2\right]^{1/2}$; where $\lvert v_i\rvert$ is the magnitude of the individual wind vector.
6.	$\bar{X}$	Mean of the zonal (East-West) components of the wind. A minus sign (-) indicates a westerly component. A plus (+) indicates an easterly component.	= $\Sigma\lvert v_i\rvert \sin\theta_i/N$
7.	S_x	Standard deviation of the zonal wind components.	= $\left[\frac{N\Sigma(\lvert v_i\rvert \sin\theta_i)^2 - (\Sigma\lvert v_i\rvert \sin\theta_i)^2}{N(N-1)}\right]^{1/2}$
8.	$\bar{Y}$	Mean of the meridional (North-South) components of the wind. A minus sign (-) indicates a southerly component. A plus sign (+) indicates a northerly component.	= $\Sigma\lvert v_i\rvert \cos\theta_i/N$
9.	S_y	Standard deviation of the meridional wind components.	= $\left[\frac{N\Sigma(\lvert v_i\rvert \cos\theta_i)^2 - (\Sigma\lvert v_i\rvert \cos\theta_i)^2}{N(N-1)}\right]^{1/2}$
10.	r	Correlation of the zonal to the meridional components.	= $\frac{N\Sigma(\lvert v_i\rvert \cos\theta_i)(\lvert v_i\rvert \sin\theta_i) - (\Sigma\lvert v_i\rvert \cos\theta_i)(\Sigma\lvert v_i\rvert \sin\theta_i)}{N(N-1)\,S_xS_y}$
11.	Ψ	Angle of rotation of elliptic axes of wind distribution measured in degrees counter clockwise from the east-west axis; 090° (N), 180° (W), 270° (S) and 0° (E).	$\tan 2\Psi = 2\,r\,S_xS_y/(S_x^2 - S_y^2)$
12.	S_a	Standard deviation of the wind components along the major axis of the ellipse.	= $\sqrt{k_1}$; $k_1 > k_2$; $\begin{vmatrix} S_x^2 - k, & S_xS_y\,r \\ S_xS_y\,r, & S_y^2 - k \end{vmatrix} = 0$
13.	S_b	Standard deviation of the wind components along the minor axis of the ellipse.	= $\sqrt{k_2}$; k_1 and k_2 are the variances along the major and minor axes of the wind distribution ellipses. These are the solutions of the determinantal equation shown.
14.	S_v/S_s	Ratio of the standard vector deviation to the square root of the difference between the squares of the scalar and vector means.	= $\left[\left(\frac{\Sigma\lvert v_i\rvert}{N}\right)^2 - \left(\frac{\lvert(\Sigma v_i)\rvert}{N}\right)^2\right]^{1/2}$
15.	N	Number of observations used.	

Note: The minus sign is placed after the number to which it applies.
Wind speed units are in knots.
